	Index	27

Low-level software tuuls, organized into drawers.

CHAPTER 1

tuulbash

kickpy - A bash script intended to kick a Python script from an environment that doesn't have an established Python environment yet. For example:

```
./kickpy.sh example.py
```

Tuuls for command line interface (CLI).

2.1 cli_color.py

Define colors and font styles for use in CLI output

```
class tuulcli.cli_color.CliColor
    Contain the list of colors and font styles
```

Automation tools for common tasks around software development

3.1 pipeline_steps.py

Provide routines for outputting automated pipeline steps consistently

`tuuldevops.pipeline_steps.major_step(title, description)`
Output title and description of a major step in the pipeline

3.2 tag_current_version.py

Git tag the commit on the current branch with the current version of this software

`tuuldevops.tag_current_version.tag_product_version(conf_filename)`
Git tag the commit on the current branch with the version of this software given in `conf_filename`

3.3 update_version.py

Update the version in the tuulbachs-formatted YAML version file

`tuuldevops.update_version.update_product_version(conf_filename, new_ver)`
Write a `new_ver` as the new value for the 'version' key in the `conf_filename`

An opinionated set of Git tuuls.

4.1 check_clean.py

Check the Git working tree

```
tuulgit.check_clean.is_clean_working_tree()
```

Return a boolean indicating whether the Git working tree is clean or not

4.2 tag_commit.py

Git tag the commit on the current branch, *only if* the working tree is clean

```
tuulgit.tag_commit.tag_current(tag)
```

Git tag (annotated) the current commit from a clean working tree

Raises *TuulError* – when the caller attempts to tag an unclean working tree or to use a tag that already exists on the repo

```
tuulgit.tag_commit.tag_current_signed(tag)
```

Git tag (signed) the current commit from a clean working tree

Raises *TuulError* – when the caller attempts to tag an unclean working tree or to use a tag that already exists on the repo

```
tuulgit.tag_commit.tag_delete_local(tag)
```

Delete the named Git tag (local only). This function does *not* delete remote tags

Raises *TuulError* – if the tag delete fails

CHAPTER 5

tuulpy

subpResult.py - Run a command from Python and return the result. Example:: `python subpResult.py`

Parsing tuuls for a tuulbachs-formatted version YAML input file.

6.1 version.py

Utility functions for managing a tuulbachs-formatted version YAML file

```
tuulver.version.bump_build(filename)
    Bump the “build” portion of the version from the input YAML filename

tuulver.version.bump_major(filename)
    Bump the major portion of the version from the input YAML filename

tuulver.version.bump_minor(filename)
    Bump the minor portion of the version from the input YAML filename

tuulver.version.bump_patch(filename)
    Bump the patch portion of the version from the input YAML filename

tuulver.version.bump_pre(filename, prebase='pre')
    Bump the “pre” portion of the version from the input YAML filename

tuulver.version.emit_product_name(filename)
    Return the product name value from the input YAML filename

tuulver.version.emit_version(filename)
    Return the version value from the input YAML filename
```

Low level tuuls for interacting with YAML files.

7.1 parse.py

Parse an input YAML file

```
tuulyaml.parse.parse_yaml (filename)  
    Given input path filename, parse YAML file.
```

7.2 update_simple_value.py

Update a simple top-level value in a YAML file

```
tuulyaml.update_simple_value.update_value (inout_path, existing_key, new_value)  
    Update existing_key to new_value in the existing inout_path YAML file.
```

CHAPTER 8

install

Note that `tuulbachs` is not yet published at PyPi.

1. Set up and activate a Python [virtual environment](#) at the top level of this project
2. `cd` to the local `auto` directory
3. `./install_local.sh`

Guidance about how to deploy updates to tuulbachs itself

1. Follow *install* guidance
2. Decide which type of *semantic version* upgrade this is (major, minor, patch, etc.)
3. From `tuulver/version.py`, use the appropriate `bump_*` function to update the version string in `version.yaml`
4. Commit the version change to Git
5. From `tuuldevops/tag_current_version.py`, use the `tag_product_version` function to properly tag this release
6. Push the Git update (including tags) to this repo's remotes

This is code intended for use by tuulbachs itself, not external users.

10.1 exceptions.py

This module contains the set of tuulbachs' exceptions.

exception `tuulbachs.exception.TuulError` (*msg=None*)

The parent exception from which all other Tuulbachs Python exceptions are derived.
