<b>10</b>	<b>internal API</b>	<b>21</b>
<b>11</b>	<b>Indices and tables</b>	<b>23</b>

Low-level software tuuls, organized into drawers.

# CHAPTER 1

---

tuulbash

---

**kickpy** - A bash script intended to kick a Python script from an environment that doesn't have an established Python environment yet. For example:

```
./kickpy.sh example.py
```

## CHAPTER 2

---

tuulcli

---

Tuuls for command line interface (CLI).

## CHAPTER 3

---

tuuldevops

---

Automation tuuls for common tasks around software development

## CHAPTER 4

---

tuulgit

---

An opinionated set of Git tuuls.

## CHAPTER 5

---

tuulpy

---

**subpResult.py** - Run a command from Python and return the result. Example:: `python subpResult.py`

## CHAPTER 6

---

tuulver

---

Parsing tuuls for a tuulbachs-formatted version YAML input file.

## CHAPTER 7

---

tuulyaml

---

Low level tuuls for interacting with YAML files.

## CHAPTER 8

---

### install

---

Note that tuulbachs is not yet published at PyPi.

1. Set up and activate a Python [virtual environment](#) at the top level of this project
2. `pip install -r requirements.txt`
3. `cd` to the local `auto` directory
4. `./install_local.sh`

Guidance about how to deploy updates to tuulbachs itself

1. Follow *install* guidance
2. Decide which type of *semantic version* upgrade this is (major, minor, patch, etc.)
3. From `tuulver/version.py`, use the appropriate `bump_*` function to update the version string in `version.yaml`
4. Commit the version change to Git
5. From `tuuldevops/tag_current_version.py`, use the `tag_product_version` function to properly tag this release
6. Push the Git update (including tags) to this repo's remotes

## CHAPTER 10

---

internal API

---

This is code intended for use by tuulbachs itself, not external users.

# CHAPTER 11

---

## Indices and tables

---

- `genindex`
- `modindex`
